

FCS456 Multi channel sequencing boxes

Key Features

- Available in 2,4,6, or 8 Channel variants
- Individual Pass/Fail indication per channel
- Individual Active Channel indication
- Replicator Pass/Fail outputs for interface to external control system
- Complete with interface cables to FCO750/FCO790 Leak Detector
- Can operate in Station A/B mode minimising load time delays

The FCS456 multi channel sequence box offers an effective solution to the common question of whether multiple items can be tested simultaneously. The ability to test 8 parts at once or two banks of 4 reduces cycle times and maximises stability by filling and stabilising multiple parts in parallel.

At a glance the user can see which part is on test, which have failed and which have passed and a user's time can be used to greater effect loading parts into one bank whilst the other is testing.

Tests multiple parts to maximise productivity
